TACO

Cool it!

The LOFlo Mixing Block (LMB) is the latest addition to our LoadMatch® System. It works as a complete injection mixing station, delivering the correct temperature – from low to high or high to low – at the terminal unit without affecting the pipe size.

The LMB provides only the flow and the temperature of water needed to satisfy the zone load at any given time.

It's a convenient way to maintain a typical Delta "T" without increasing pipe sizes.

This new idea lowers both energy consumption plus initial material and installation costs. It also results in precise control of the room temperature. Cool.
